Top 5 WMS benefits explained

Warehouse Management System (WMS) is a software solution that allows complete control over all warehousing processes and accurate insight into the state of the inventory, from the moment the goods enter to the moment they exit the warehouse.

In this simple infographic we'll briefly explain top 5 benefits you get after implementing the WMS system.

1 Lower operational costs

WMS system makes optimal use of storage space, depending on the type of goods, their turnover and the way they enter and exit the warehouse (FIFO; FEFO; LIFO), in order to keep storage costs as low as possible. At the same time, warehouse workers operate faster and wit less errors, and the warehouse manager has detailed insight into their productivity which results in lower costs.

2 Improved employee productivity

The mobile app navigates warehouse staff to work by pre-defined logic, leaving them no space for errors, and at the same time through analytics, it gives the warehouse manager a better insight into their productivity. Not to mention way faster staff onboarding, from usual 3 months to less than 2 weeks, all thanks to the intuitive app.

3 Real-time inventory tracking

Each product that enters the warehouse has a unique barcode or serial number based on which you always know where it is located and in which quantities. This gives you an insight into the movement of goods and allows you to notice patterns in the required quantities of goods depending on your sales volumes.

4 Process automatization and integration with 3rd party solutions

Most of your processes in the warehouse are going to be faster and leaner, all thanks to barcode scanning of items and automated documents exchange. When you integrate your ERP system with WMS, all paper documentation is gone and you save your precious time usually spent on administration and manual work.

5 Floor space optimization

One of the key WMS benefits is the warehouse space optimization. The software has the ability to analyze workers', machines', and goods' movement on the warehouse floor. Once you implement WMS, you can make an ideal scheme for optimal usage of floor space to the exact parameters of your warehouse needs. That way, your goods are staying in the warehouse not a minute longer than they should.
